ABSTRACT

The **Pharmacy Medicine Stock and Billing Management System** is a software application developed to automate the management of medicines, stock control, and billing operations in a pharmacy. In many small and medium pharmacies, stock handling and billing are done manually, which can lead to errors, delays, and difficulty in maintaining records.The system allows users to select food items from a predefined menu, enter the
quantity of each item, and automatically calculate the total bill including applicable taxes such as GST. The application is developed using **Core Java programming concepts**, including classes, objects, methods, conditional statements, loops, and exception handling. The project can be implemented either as a **console based application or using Java Swing for a graphical user interface**.The main objective of the system is to improve billing efficiency, reduce human errors, and provide a faster service to customers. The system generates a clear and structured bill that displays the ordered items, quantities, prices, subtotal, tax, and final payable amount.This project demonstrates the practical implementation of **object-oriented programming concepts in Java** and provides a basic foundation for developing more advanced restaurant management systems in the future.

1. INTRODUCTION

In today's fast-paced world, the healthcare sector plays a crucial role in ensuring the well-being of people.Pharmacies are an essential part of this system, as they are responsible for dispensing medicines and healthcareproducts to patients. Efficient management of pharmacy operations, especially medicine stock and billing, isnecessary to provide quick and accurate service to customers.Traditionally, many small and medium-scalepharmacies rely on manual methods for maintaining records and generating bills. These methods includehandwritten registers, notebooks, or simple calculators. While such systems may work for small volumes, theybecome inefficient as the number of medicines and customers increases. Manual systems are time-consumingand highly prone to human errors, which can lead to incorrect billing, improper stock tracking, and poor recordmanagement.One of the major challenges in manual pharmacy management is maintaining accurate stockinformation. Pharmacists must keep track of hundreds of medicines, each with different quantities and expirydates. Without an automated system, it becomes difficult to monitor stock levels effectively. This may result inoverstocking, shortage of essential medicines, or even the sale of expired products, which can pose serioushealth risks.Another important issue is the billing process. Manual billing requires the pharmacist to calculatethe total cost of medicines using a calculator or by hand. This process is not only slow but also increases thechances of calculation errors. Incorrect billing can lead to financial loss for the pharmacy and dissatisfactionamong customers. In busy situations, such delays can reduce the overall efficiency of the pharmacy.

1.1 Objective

The main objectives of this project are:

- To design and develop a computerized pharmacy management system
- To automate the process of stock management
- To generate accurate and quick billing
- To reduce manual errors in calculations
- To maintain proper records of medicines and sales
- To track expiry dates and avoid selling expired medicines
- To improve customer service by reducing waiting time
- To demonstrate the use of Core Java concepts in real-world applicatio

1.2 Overview

The Pharmacy Medicine Stock and Billing Management System is a menu-driven application developed usingava. The system provides a simple and user-friendly interface for managing pharmacy operations.The application allows the user to add new medicines, update stock details, check availability, and generatebills. All operations are performed efficiently using programming logic.The system stores medicine information and updates stock automatically after each sale. During billing, theystem calculates the total price based on quantity and applies tax to generate the final amount.

1.3 Features

- The system allows adding new medicines with details like name, price, quantity, and expiry date.
- It helps in updating and deleting existing medicine records easily.
- The system maintains accurate stock information of all medicines.It automatically updates the stock after each sale.
- The system tracks expiry dates of medicines to avoid selling expired products.It provides an easy and fast billing system for customers.The system calculates the total amount automatically.
- It includes automatic GST/tax calculation in billing
- .The system generates a clear and structured bill (invoice).
- It provides a simple and user-friendly menu-driven interface
- .The system stores data permanently using file handlingIt retrieves saved data when the program is restarted.
- The system handles errors using exception handling.
- It reduces manual work and improves efficiency.The system saves time and minimizes calculation errors.

2. PROGRAM ANALYSIS

Program analysis is an important phase in software development where the problem is studied in detail and the requirements of the system are clearly identified. In the Pharmacy Medicine Stock and Billing Management System, this phase helps in understanding the difficulties faced in manual stock management and billing processes. It focuses on identifying issues such as incorrect billing, poor stock tracking, and lack of expiry monitoring in existing systems. Based on this analysis, the necessary features like medicine management, stock control, and automated billing are defined. This stage ensures that the developed system provides an efficient, accurate, and user-friendly solution for pharmacy operations.

2.1 Problem Definition

- Errors in bill calculation
- Difficulty in maintaining accurate stock records
- Lack of proper tracking of medicine expiry dates
- Time-consuming billing process
- Poor record management of sales and purchases

These problems highlight the need for an automated system that can perform calculations accurately and efficiently.

2.2 Project Overview

The Pharmacy Medicine Stock and Billing Management System is a Java-based application developed to simplify and automate the management of medicine stock and billing in pharmacies.The system provides a menu-driven interface where users can add medicines,view available stock, and generate bills based on ccstomer purchases. The system automatically calculates the total cost of selected medicines and generates an accurate.

• Adding and managing medicine details such as name, price, quantity, and expiry date
• Displaying available medicines and stock information
• Selecting medicines and entering quantity for billing
• Automatically calculating the total cost of medicines
• Computing subtotal and tax (GST) amount
• Generating the final bill for the customer

2.3 Scopes and Limitations

Scope

Managing medicine details such as name, price, quantity, and expiry date
• Maintaining accurate stock records of all medicines
• Updating stock automatically after each transaction
• Tracking expiry dates to avoid selling expired medicines
• Processing customer purchases efficiently
• Calculating the total bill automatically
• Computing GST/tax and including it in the final bill

Limitations

- Managing medicine details such as name, price, quantity, and expiry date
- Maintaining accurate stock records of all medicines
- Updating stock automatically after each transaction
- Tracking expiry dates to avoid selling expired medicines

3.SYSTEM DESIGN

System design is the stage where the structure and components of the system are planned before the actual implementation. In this phase, the system is divided into different modules, and the workflow of the application is clearly defined. Proper system design helps in organizing the program efficiently and makes development easier and more systematic.The Pharmacy Medicine Stock and Billing Management System is designed as a menu-driven application where users can add medicines, view stock details, and generate bills automatically based on customer purchases. The system ensures smooth handling of pharmacy operations with accuracy and speed.The system is divided into several modules to perform specific tasks. Each module is responsible for handling a particular function such as managing medicine details, tracking stock, processing billing, and storing data. This modular design improves the clarity, maintainability, and efficiency of the data.

3.1 Modules

The main modules of the Pharmacy Medicine Stock and Billing Management System are explained below:

1. Medicine Management Module

This module is responsible for managing all medicine-related details such as name, price, quantity, and expiry date. It allows the user to add new medicines and maintain updated records.

Functions:

- Adding new medicines to the system
- Updating existing medicine details
- Deleting medicines if required
- Storing medicine information

2. Stock Display Module

This module displays the list of available medicines along with their details such as price, quantity, and expiry
date.
Example Display:
1. Paracetamol ₹20 Qty: 50 Exp: 12/2026
2. Amoxicillin ₹50 Qty: 30 Exp: 10/2025
3. Cough Syrup ₹80 Qty: 20 Exp: 08/2025
The stock is displayed so that the user can easily view available medicines before billing.

3. Billing Module

This module allows the user to select medicines and enter the required quantity for generating a bill.
Functions of this module include:
• Selecting medicines from the list
• Entering quantity required
• Checking availability of stock
• Storing selected items for billing
The system allows multiple medicines to be selected before generating the final bill.

4. Bill Calculation Module

This module performs all billing-related calculations automatically.
The system calculates:
• Total cost of each medicine
• Subtotal of all selected medicines
• Applicable tax (GST)
• Final payable amount
The calculation is done using Java programming logic.
Example Calculation:
Item Total = Price × Quantity
GST = 5% of Subtotal
Final Bill = Subtotal + GST

---

5. Invoice Generation Module

This module generates the final bill for the customer.

The bill includes:

• Medicine name

• Quantity• Price

• Subtotal

• GST amount

• Final bill amount

Example Bill Output:

- ----- PHARMACY BILL ------

Item Qty	Price
Paracetamol	2 40
Cough Syrup	1 80
Subtotal	1 20
GST (5%)	6
Total	126

Thank You! Vist Again !

6. Exit Module

This module allows the user to exit the application safely after completing all operations. When the user selects the exit option, the system saves data (if required) and terminates the program

---

4.METHODOLOGY

Methodology describes the systematic process followed to develop the *Pharmacy Medicine Stock and Billing Management System*, ensuring efficient and accurate management of pharmacy operations. The development began with problem analysis, where issues in the manual system such as stock mismanagement, billing errors, and difficulty in tracking expiry dates were identified. In the system design phase, the project was structuredinto modules like medicine management, stock control, billing, and expiry tracking, with simple and user friendly design planning. During program development, the system was implemented using C language with functions for adding medicines, updating stock, searching records, and generating bills. The system was then tested and validated using various inputs to ensure correctness, reliability, and error-free performance. Finally, the results were documented with program details, sample outputs, and explanations, making the system easy to understand and maintain.

4.1. Problem Analysis

In this phase, the problem is studied and analyzed in detail. The requirements of the system are identified based
on the needs of pharmacy operations.
The main problems identified in manual pharmacy management systems are:

- Manual stock maintenance may lead to incorrect quantity records.
- Difficulty in tracking expiry dates of medicines.
- Billing calculations may lead to errors.
- Preparing bills manually consumes more time.
- Difficult to search and update medicine details quickly.
- Lack of proper records for sales and stock transactions.

Based on these problems, the system requirements were defined to develop an automated application that
efficiently manages medicine stock, tracks expiry dates, and generates accurate bills, thereby simplifying
pharmacy operations.

4.2. System Design

In this stage, the overall structure of the system is designed before coding begins.
The system is divided into modules such as:

- Medicine Management Module
- Stock Management Module
- Billing Module
- Expiry Tracking Module
- Search and Update Module
- Exit Module

The program flow and structure are designed in a simple and user-friendly manner so that the user can easily add, update, search medicines, manage stock, and generate bills efficiently

4.3. Program Development

After designing the system, the program is implemented using the C programming language.The following steps were followed during development:

- Creation of functions for different modules
- Implementation of menu-driven logic
- Writing code for medicine stock management
- Developing billing calculation functionality
- Handling user input and validation
- Displaying medicine details and final bill

Core C concepts such as functions, arrays, structures, loops, conditional statements, and file handling were used during development to ensure efficient and accurate system performance

4.4. Testing and Validation

Testing ensures that the program works correctly and produces the expected results. Different test cases were used to check the functionality of the system.

Test Case	Expected Result
Add new medicine	Medicine details stored correctly
Search Medicine	Correct medicine information displayed
Generate bill	Error handled properly
Enter invalid input	Your paragraph text

This phase ensures that the program runs without errors, maintains accurate stock records, and generates correct billing results efficiently

4.5. Result and Documentation

After successful testing, the results of the system are documented. The system manages medicine stock efficiently and generates the final bill based on the selected medicines and quantities.The results are demonstrated through program execution and screenshots showing the input and output of the system, including adding medicines, updating stock, and billing details.Proper documentation is prepared to clearly explain thesystem design, implementation, modules, and overall working of the application, making it easy to understand and use

4.6. Algorithm

Algorithm for Pharmacy Medicine Stock and Billing

Management System

1. Start the program.
2. Display the list of available medicines with their prices.
3. Ask the user to select a medicine.
4. Enter the required quantity of the selected medicine.
5. Check the availability of stock.
6. Calculate the cost of the selected medicine.
7. Add the cost to the total bill.
8. Update the medicine stock after purchase.
9. Repeat steps 3–8 for additional medicines if required.
10. Calculate the total bill amount.
11. Display the final bill to the user.
12. Stop the program.

Enter number of items: 1
Select medicine number: 1
Enter quantity: 2

Total: ?80.0
GST: ?4.0
Final Amount: ?84.0
```

7. DISCUSSION & CONCLUSION

7.1 Discussion :

The Pharmacy Medicine Stock and Billing Management System was developed to automate the process of managing medicine stock and billing in pharmacies. The system allows users to add medicines, update stock details, search for medicines, and generate bills automatically.During the development process, core C programming concepts such as functions, arrays, structures, loops, and conditional statements were applied. The system efficiently manages medicine records, tracks stock availability, and performs accurate billing operations.The system was tested with different inputs to ensure that it performs all operations correctly, including stock updates and bill generation. The results show that the system reduces manual effort, minimizes errors, and improves efficiency in pharmacy management.

7.2 Conclusion

The Pharmacy Medicine Stock and Billing Management System was developed to automate the process of managing medicine stock and billing in pharmacies. The system allows users to add medicines, update stock, search for medicines, and generate bills automatically.During the development process, core C programming concepts such as functions, arrays, structures, loops, and conditional statements were applied. The system successfully manages stock details, tracks medicine availability, and performs accurate billing operations.The system was tested with different inputs to ensure that it works correctly and produces accurate results. The results show that the system reduces manual effort, minimizes errors in stock management and billing, and improves overall efficiency in pharmacy operations**.**
